Because of MySQL's special use of ORDER BY with UPDATE (this is not standard SQL).. To update data in a table or view, use the UPDATE statement UPDATE TrialBalance SET TransactionBalance =.

Where number is non-NULL, @n is assigned the value of number Where number is NULL, the COALESCE() defaults to the previous value of @n.. To ensure stable results are returned, use the SNAPSHOT ISOLATION isolation level, or replace COALESCE with the ISNULL function.. Aaj Na Choddenge (Holi Dance Mix Dj Vijay) Sheila Ki Holi Munni Ki Choli (Holi Dance Mix Dj Vijay).. Alternatively, you can rewrite the query to push the It starts out NULL, and is assigned a value on each row as the UPDATE runs through rows.. In either case, this becomes the new value of the number column and the UPDATE proceeds to the next row.

I recently had to solve this in a relatively large resultset (1000 rows with 12 columns each needing this type of 'show me last non-null value if this value is null on the current row') and using the update method with a top 1 select for the previous known value (or subquery with a top 1) ran super slow.. I am using SQL 2005 and the syntax for a variable replacement is slightly different than mysql: UPDATE mytable SET @n = COALESCE(number, @n), number = COALESCE(number, @n) ORDER BY date The first set statement updates the value of the variable @n to the current row's value of 'number' if the 'number' is not null (COALESCE returns the first non-null argument you pass into it) The second set statement updates the actual column value for 'number' to itself (if not null) or the variable @n (which always contains the last non NULL value encountered).. That's why it's important to tell us the brand you're using It's nice to be vendor-independent, as @Pax commented, but failing that, it's also nice to use your chosen brand of database to its fullest advantage. The order of the UPDATE is predictable, because of MySQL's special use of ORDER BY with UPDATE (this is not standard SQL).. How do I use a merge statement to only replace null or blank fields Null value replace to 'absent'? Aug 30, 2017 - For example, the code can return NULL under the READ COMMITTED isolation level in a multi-user environment.. Explanation of the above query: @n is a MySQL user variable Replace In Update SqlSQL QUERY replace NULL value in a row with a value from the previous known value.. Here's a MySQL solution: UPDATE mytable SET number = (@n:= COALESCE(number, @n)) ORDER BY date; This is concise, but won't necessary work in other brands of RDBMS.
